

DAY 4 - BUILDING DYNAMIC FRONTEND COMPONENTS FOR YOUR MARKETPLACE:

Components:

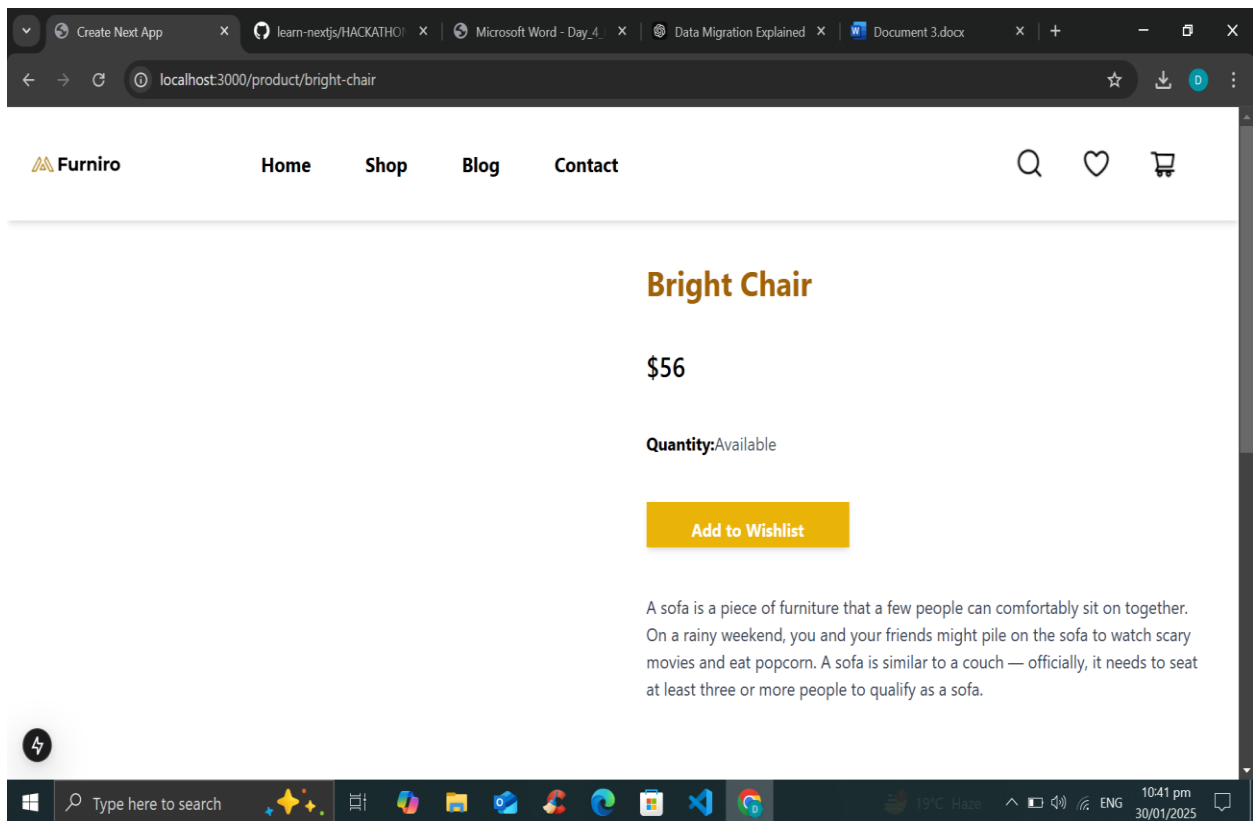

1.Product Listing Component:

A **product listing component** is a user interface (UI) element typically used on websites or applications that display a collection of products. This component is common in e-commerce sites where products are listed in categories or collections for customers to browse. It usually includes details like product images, titles, descriptions, prices, and potentially "add to cart" buttons or other interactive features.

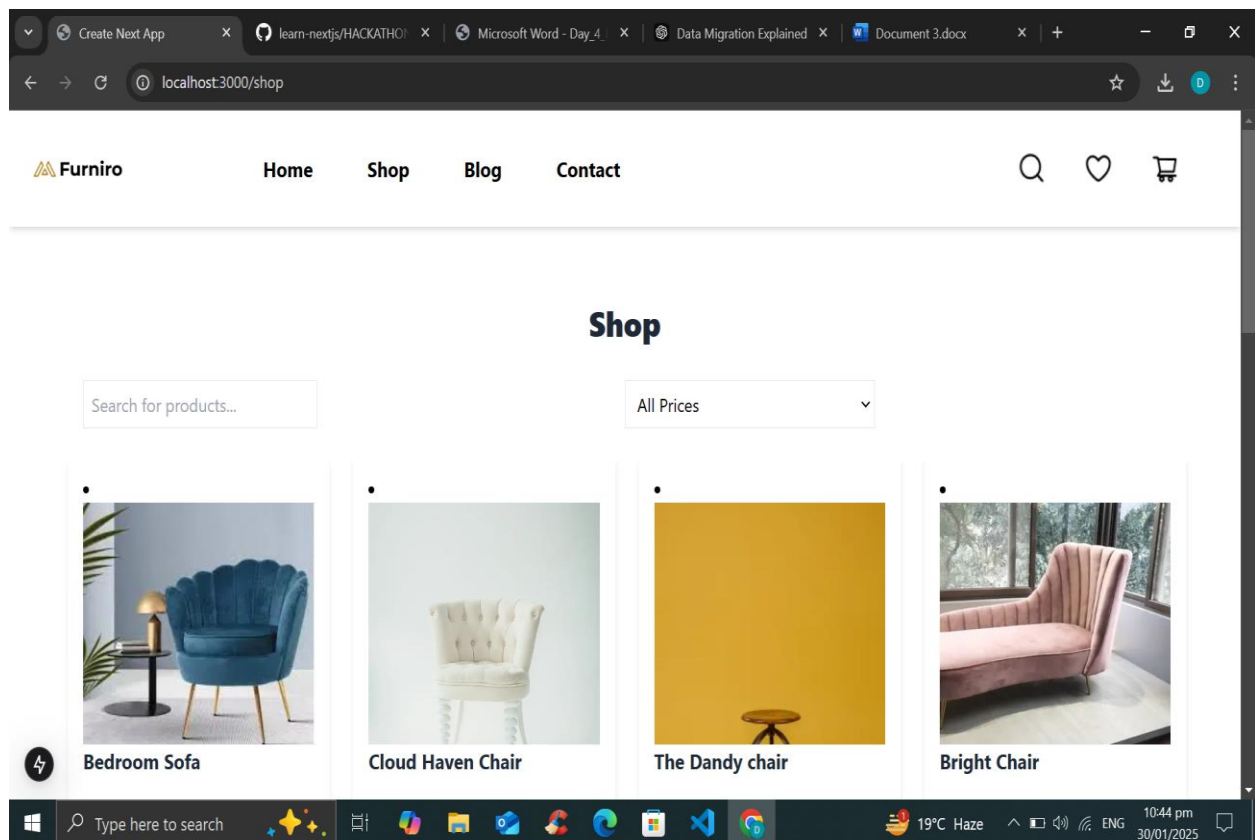

2.Product Detail Component:

A **Product Detail Component** is a UI element that provides detailed information about a single product on an e-commerce website or application. Unlike a product listing component, which displays multiple products in a grid or list format, the product detail component is focused on showcasing one product at a time.

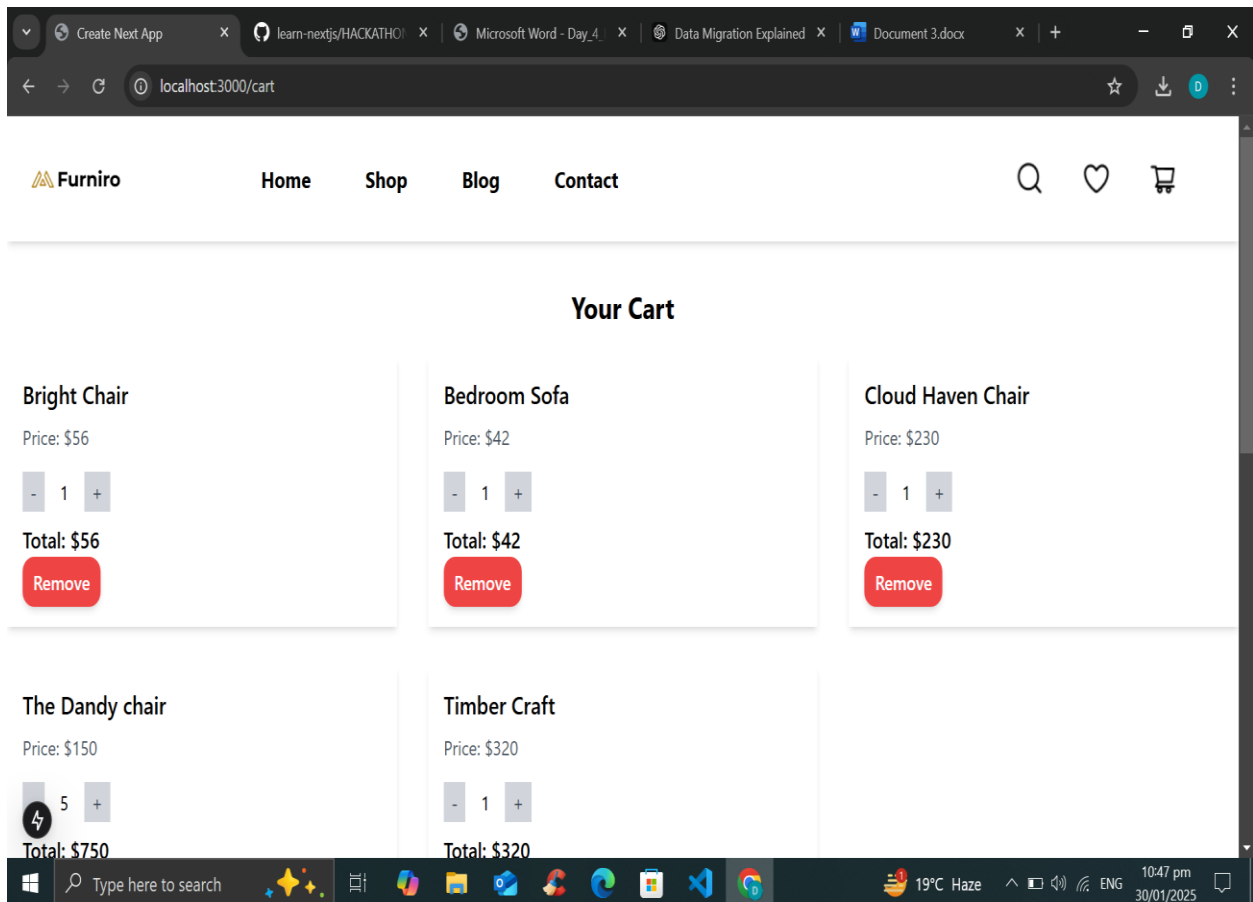

3. Search Bar:

A **Search Bar** is a user interface (UI) element that allows users to enter text to search for specific content, products, or information on a website or application.

4. Cart Component:

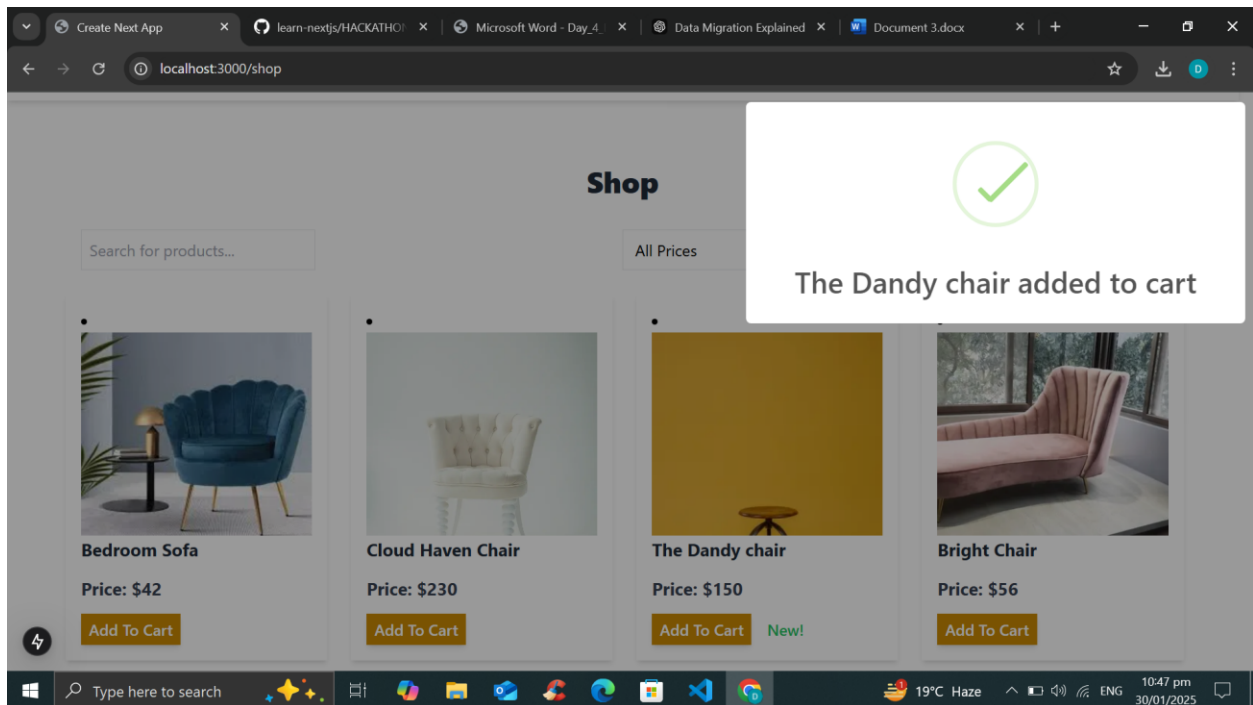

A **Cart Component** is a user interface (UI) element typically found in e-commerce websites or applications, allowing users to view and manage the items they've added to their shopping cart before completing the purchase.

Here I add Cart Component Features:

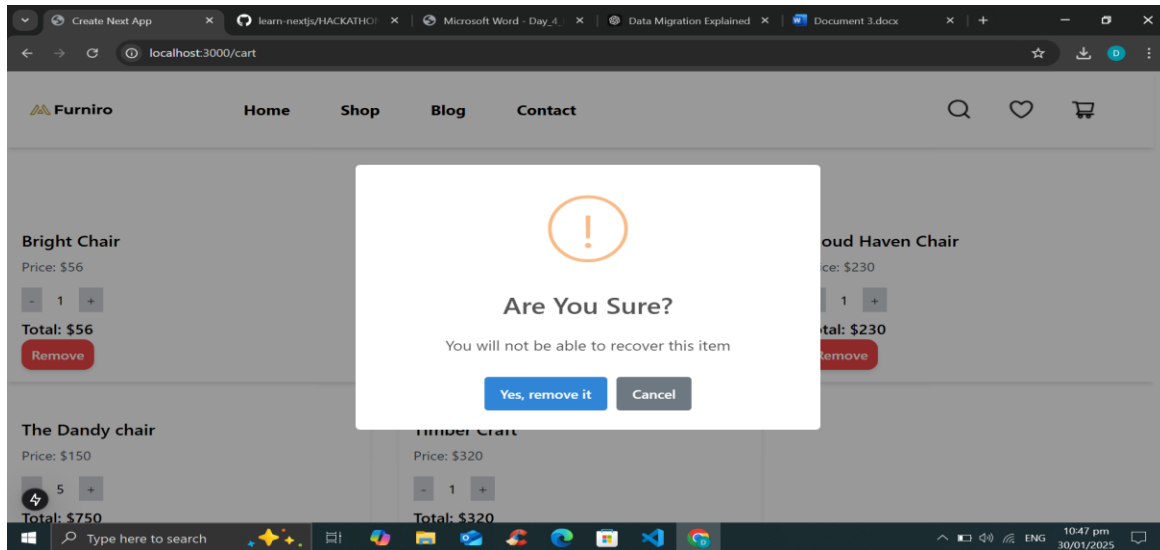

I add one alert Message :

if anyone click Add To Cart button so they will show one message
“Are you Sure” to remove Products.

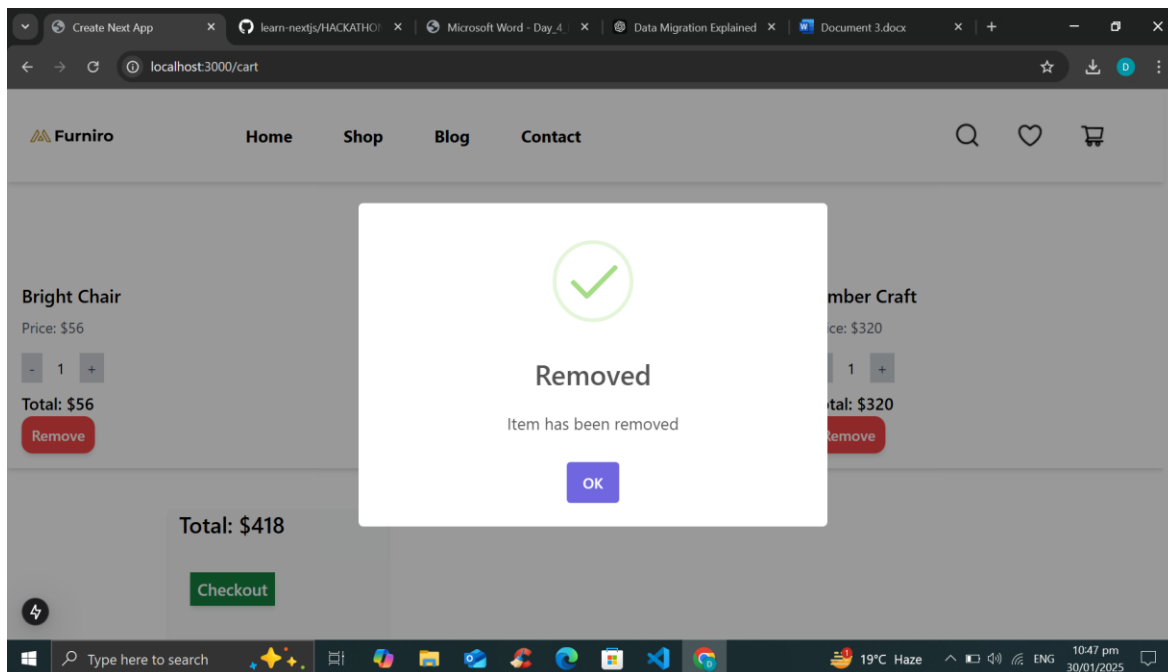

I also add one alert Message :

if anyone click Remove button so it show one Remove Message.

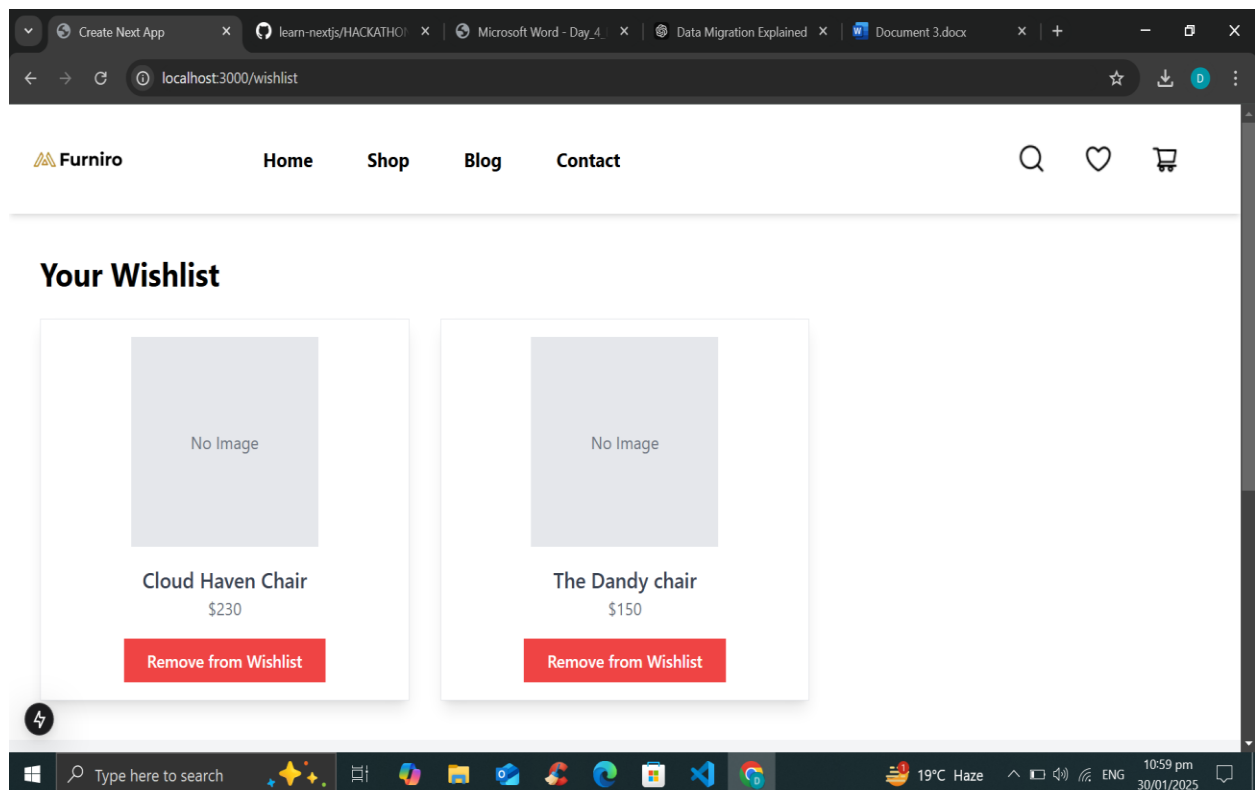

I also add Successful Message:

You click Remove button so it will another successfully message.

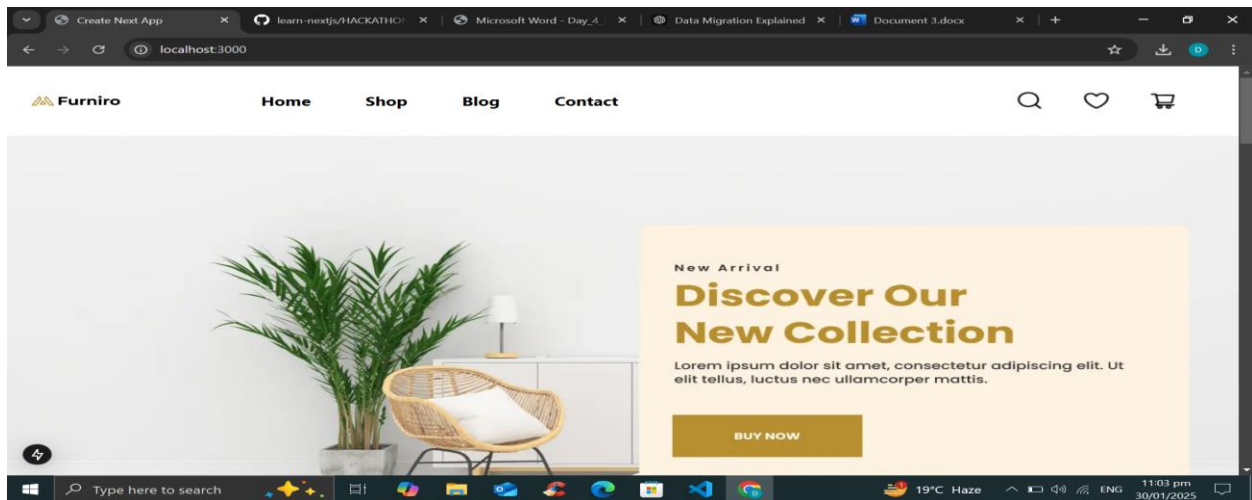

5. *Wishlist Component:*

A **Wishlist Component** is a user interface (UI) element typically found in e-commerce websites or applications. It allows users to save products or items they are interested in for future reference or purchase. Unlike a shopping cart, which is focused on products the user intends to buy immediately, a wishlist is more of a "save for later" feature where users can store items they may want to purchase at a later time.

6. Header component:

A **Header Component** is a user interface (UI) element commonly found at the top of a website or web application. It serves as the navigation hub for users and typically contains elements like the site's logo, navigation links, search bar, login/sign-up buttons, and sometimes notifications, user profile information, or cart icons

7. Footer Components:

A **Footer Component** is a user interface (UI) element that appears at the bottom of a website or application. It typically contains supplementary information and links, such as contact details, terms of service, privacy policies, social media icons, and additional navigation options.
